AutoCAD's capabilities include:
Creating 2D and 3D drawings.
Creating dynamic hyperlinks in a 2D drawing. Creating callouts on a 2D drawing. The drawing windows in AutoCAD are covered with dynamic blocks, which are used to make symbols, drawings, and tables easily insertable into any other drawing. Creating families of objects in a drawing that can be edited or

deleted as a unit. Attaching files, either as individual files or as a file set, to a drawing. Attaching an entire website to a drawing to be the background of that drawing. Creating templates, which can be used to create drawings automatically, but also can be used to create templates for customizations. Creating an image of a drawing and placing that image on another drawing. Comparing objects in two drawings and making changes to

one of the drawings. Creating annotation tags for attributes of objects. Creating custom annotations with predefined or user-defined properties and formatting. Creating tables that are dynamically created from the drawing area in a drawing. Creating arrows. Creating text, both in type and in AutoText, which can be easily moved, copied, deleted, and adjusted. Locating object properties and attributes in the drawing.

Locating objects that are placed in a drawing on the drawing area, even when the objects are moved or deleted. Editing or deleting objects. Editing the scale of a drawing. Editing the orientation and scaling of objects. Editing line width, stroke weight, and dash pattern. Editing the point type (circle, rectangle, or ellipse). Editing fonts and font formats. Editing the link and transparency settings of objects. Editing reference points, which

are used to control the orientation of a drawing or move objects in a drawing. Editing the colors and color settings of objects. Editing text properties, such as font, justification, and vertical and horizontal alignment. Editing the text flow, which allows the text to flow from one part of the drawing to another. Editing the shape of text, such as the alignment and wrap settings for different character sizes.

User interface After installation and configuration, the user interface (UI) of AutoCAD Serial Key 2007 can be customized to the user's preferences. The user interface in AutoCAD 2014 can also be customized. A user may choose to keep the 2007 interface and add a few ribbon tabs or tabs from the new ribbon system. Actions are grouped in the Ribbon along the top of the

drawing window. Each action can be toggled on and off or disabled to not display in the ribbon. When toggling on or off, the "Disabled" status is also shown. There is also a Favorites bar in the application. The Favorites bar has a click-to-treat menu of actions and an application menu. The Favorites bar can be removed or reordered. There are no custom menus. Actions, menus and toolbars are saved to the application to avoid

needing to open the application every time. Newer versions of AutoCAD and other applications that support the Windows shell color scheme use a similar mechanism to identify the same feature. Useful information

Useful information can be displayed in a number of areas including the status bar, tool tips, toolbars, and dialogs. The last three display this information at the right-hand side of the object.

Status bar The status bar is

located in the bottom-left corner of the drawing area. The status bar displays information such as the toolbars that are active, which views are displayed and the selected print settings. It also displays the drawing name, date, and time. When the drawing is closed or zoomed out (by mouse click), the status bar is hidden.

Toolbars The top of the drawing window contains the 3D object tools. There are 3D solid tools, which are typically accessed by

selecting the icon, the Boolean tools, which are typically accessed by clicking on the tool icon, or the non-solid geometry tools, which are typically accessed by clicking on the tool icon. The other toolbar has the common drawing commands that are not automatically activated.

Tool tips The tool tips of an object on the drawing window are typically activated by holding the Alt key and clicking on the object. Each tool tip describes

the object and provides information such as the material, layer, linetype, and so on. The tool tip can also provide information on the object such as the next command, zoomed-in or zoomed-out state a1d647c40b
