= Please input the following parameters in the image you want to be rescaled. Acute effects of oestrogen and progestogen on CNS monoamines. To determine whether the acute effects of oestrogen and progestogen, apart from their well known effects on the endocrine and immune systems, also produce direct effects on monoamine neurotransmitter systems in the central

nervous system. Patients with endometriosis were treated with a regimen of oestrogen and norgestimate (15 micrograms/day) in the form of a 17 beta-oestradiol implant in association with oral norgestimate (1500 micrograms) for 5 days. Sixteen patients with normal menses were treated with oral norgestimate (1500 micrograms) for 5 days. The effects on extracellular monoamines in the hypothalamus and corpus

striatum were measured in vivo using microdialysis coupled with high performance liquid chromatography with electrochemical detection. The concentrations of the tryptophan metabolite 5-hydroxy-indoleacetic acid in the hypothalamus of five patients were similar in the two treatment conditions. In the corpus striatum of these patients, an increase in 5-hydroxy-indoleacetic acid occurred after norgestimate

treatment, which was absent after oestrogen treatment. However, oestrogen had a more pronounced effect on the levels of noradrenaline and 3-methoxy-4-hydroxyphenylethylglycol, while the concentrations of serotonin were similar after the two treatments. The progestogen norgestimate given orally at the dose used in this study is unable to affect the levels of hypothalamic or striatal 5-hydroxy-indoleacetic acid. In contrast, it markedly

influences the extracellular levels of noradrenaline and 3-methoxy-4-hydroxyphenylglycol, and is unable to modify the extracellular levels of serotonin in the corpus striatum.
