The RML Utilities for SQL Server are designed to help you manage performance in SQL Server and look at the performance of SQL Server and the data accessed by it. The RML Utilities for SQL Server consist of three main components: - RML Utilities for SQL Server RML Utilities for SQL Server consists of a series of tests that allow you to test an instance of SQL Server to determine how well that instance of SQL Server performs. - RML Visualizer RML Visualizer is a tool that allows you to visually find performance bottlenecks within SQL Server. You can run RML Visualizer on your production SQL Server instance, and you can generate a report for any trace captured during that process. - RML Facer RML Facer allows you to replay a trace file against a SQL Server instance that has already passed RML Visualizer verification. RML Facer then uses that baseline (the instance that RML Visualizer verified) as the baseline. During this process, you can use RML Facer to automatically determine which changes have caused your SQL Server to run slower. For example, you can create a query that shows which changes have resulted in the largest change in the performance of your SQL Server. The RML Utilities for SQL Server allow you to test the SQL Server instance you wish to manage. This is done by using three different RML tests: - RML Sample Management The RML Sample Management test replicates every process that a SQL Server instance executes. It is ideal for testing SQL Server performance for new users. - RML Check Cache The RML Check Cache test replicates every read and write to the database and index in a SQL Server instance. This is the standard set of activities that a transaction performs, which is ideal for testing SQL Server performance. - RML Check Indexes The RML Check Indexes test replicates every read and write to the database and index in a SQL Server instance. This is the standard set of activities that a transaction performs, which is ideal for testing SQL Server performance. The RML Visualizer tool allows you to visually identify performance bottlenecks within SQL Server. The Visualizer is designed to help you find: - SQL Server performance issues, such as: - SQL Server processes stuck in a CPU bound loop - SQL Server processes stuck in IO bound loop - SQL Server processes using very little memory - SQL Server that is excessively slow to respond to client requests - SQL Server that is

It is easy to install, can be operated from the command line and is very efficient and fast in many common troubleshooting and tuning jobs. It is made up of a set of tools and scripts that can be used to: \* Perfmon trace and time to time web execution in an SQL Server instance \* Capture data for analysis \* Replay captured data against another SQL Server instance \* Execute SQL Server stored procedures and functions \* Compare stored procedures and functions from a baseline to today's execution \* Capture network traffic from a SQL Server instance \* Server status and performance issues \* Health status and performance of SQL Server \* Deploy database patches and hotfixes automatically Other tools and scripts are provided to: \* Compose and deploy SQL Server Express schema or data models \* Compose and deploy

#### **What's New In RML Utilities For SQL Server?**

The RML Utilities for SQL Server provide a set of tools and processes to address the most common problems with SQL Server. A Data Capture utility is used to capture trace files. These trace files can then be viewed using the RML viewer tools. This is a convenient way to see how SQL Server is performing and to analyze what was happening the last time that trace was captured. The data can also be viewed in an Excel compatible format that can be imported into Excel and analyzed. A Replay utility will replay the trace data against another instance of SQL Server. This allows you to see how the trace data performs against the baseline data. The RML Viewer tools can be used to convert the trace data to an XML format that can be imported into SQL Server Management Studio. In addition, a compatible Excel format can be created to help you analyze the data. SQL Server Management Studio provides a way to easily discover the hardware and software configuration. SQL Server Management Studio provides full support for multiple instances of SQL Server. The Replay feature allows you to replay data from an SQL Server instance to another SQL Server instance. You can also replay the trace to a different SQL Server model. In addition, it is possible to replay against an instance of SQL Server on a different server. SQL Server Management Studio includes a Query Analyzer tool that allows you to analyze the query plans that were used to process the data. For the trace capture, you will be able to analyze the XML trace files using a compatible client tool. This document describes how to use the Microsoft SharePoint Server 2010 Tools to move lists from SharePoint 2007 to SharePoint 2010. Beginning in Windows Server 2008, Microsoft introduced a new management shell that was commonly referred to as the Windows PowerShell. In addition, there were several new cmdlets introduced to make working with your system easier and less cumbersome. One of these cmdlets is the move-spsite cmdlet which is used to move or import a SharePoint site that is located in a SharePoint 2007 farm that has been upgraded to SharePoint 2010. This cmdlet was added in SharePoint 2010 and is used to move a site that is located in a SharePoint 2007 farm to SharePoint 2010. In this document, we will perform the following two tasks: By using a data transfer tool or another method, synchronize the content and the configuration of your SharePoint 2010 farm to a database that has been upgraded from SharePoint 2007 to SharePoint 2010. Configure the web application to use the
