I have two Nodejs apps (both at localhost:1337). The first app receives POST requests and the second app sends PUT requests. How can I route them to both, in a single request? First app: `app.post('/', function (req, res) { res.send('Hello World'); console.log('Called'); });` Second app: `app.put('/', function (req, res) { res.send('Hello World'); console.log('Called'); });`; A: You can use same port for both API by using proxy

server like this: Create server.js file in /usr/local/lib/node/myserver: const express = require('express'); const app = express(); app.listen(3000, () => { console.log('Running on port 3000') }); app.post('/foo', (req, res) => { res.send('Hello World'); }); app.put('/bar', (req, res) => { res.send('Hello World'); });

Proxying your requests: Install apache proxy module npm install apache-proxy Create HTTP_PROXY env variable pointing to apache-proxy like this: export HTTP_PROXY= Check if apache-proxy

appreciate the reviewer's efforts to improve
our manuscript. We have now revised the
manuscript according to the reviewers'
comments and would like to submit a revised
version that adheres to reviewers' suggestions.
In addition, we would like to change the title of
the manuscript since it is misleading. Please
find our responses below. Reviewer 1 I really
enjoyed reading this work of your research
group. I have some questions and comments
to be addressed before publication. 1) Please
consider whether I misunderstand the pathway
of the regulation of actinomycetes by SMT.
From the point of view of nucleic acid-binding
proteins, how does SMT sense DNA binding?
Thank you for giving us the opportunity to
revise our manuscript. I think you
misunderstood the role of SMT in the
regulation of actinomycetes. Actinomycetes

are Gram-positive bacteria with thick peptidoglycan layer, which is partially lost during the cell division, resulting in cell wall intermediates (CWIs) between mycelia and spores. SMT targets to the CWIs, enabling the division of bacterial cells with thick peptidoglycan layer. (Please see the references of the literature #23-25 in our revised manuscript.) 2) Regarding the experiments with the C-terminal His-tagged SMT (Figure 6C, 6D), we would like to know how are you differentiating the active form of SMT from the inactive one? In Figure 6C, the N-terminal His-tagged SMT was shown in the western blotting, while in Figure 6D, there was no His-tag.

Please tell us how the authors are differentiating them. Thank you for your

When i try to use the code editors (which i know are just as easy to use as normal editors, and i have programmed before with other software) to open xml files in FPGA_Family_2018.2.zip and FPGA_Family_2018.3.zip i get the following error: Could not find Microsoft Visual Studio 2015. Although when i run the install folder using cmd.exe i get the information: Error opening 'C:\Program Files (x86)\Microsoft Visual Studio\2017\Community\Common7\IDE\CommonExtensions\Microsoft\TeamFoundation\Team Explorer\CommonExtensions\Commands\tf.exe
