Figure \[fig:observable\]b shows the expectation value of the EFI observable $\langle \tilde{\varphi}^1(\vec{x}) \rangle$ for an ^{85}Rb BEC in the presence of the probe beam. ! [a] Illustration of the experimental setup: a ^{85}Rb Bose-Einstein condensate (BEC) is prepared on the 4D lattice potential and probed by a linearly polarized probe beam. The probe beam displaces the lattice sites and triggers the displacement that is accompanied by a change in the BEC phase for the ejected atoms. The wave-function is then collected as a function of position. The probe beam is circularly polarized for illustration purposes. b) Confirmation of the EFI from the experimental realisation of the displacement observable $\langle \tilde{\varphi}^1(\vec{x}) \rangle$. The other observables of the corresponding state $|\Psi\rangle$ are shown in (c)-(e). Here, the vertical dashed lines indicate the position of the probe beam and the laser cooling beams.[] { 6d1f23a050
